

Introduction

Downstream tasks: reconstruction, planning, mapping, rendering, pose refinement

Contributions

- We introduce AutoNeRF, a modular policy trained with Reinforcement Learning (RL) that can explore an unseen 3D scene to collect data for training a NeRF model autonomously.
- While most prior work evaluates NeRFs on rendering quality, we propose a range of downstream tasks to evaluate them for Embodied AI applications.
- We show that AutoNeRF outperforms the well-known frontier exploration algorithm as well as learnt end-to-end counterparts, and we also study the impact of different RL reward functions on the downstream performance of the NeRF model.

Modular Policy

AutoNeRF: Training Implicit Scene Representations with Autonomous Agents

Autonomous adaptation to a new scene

An autonomous agent will likely struggle with specificities of a new environment. A safe solution is **scene-specific adaptation**: AutoNeRF is used to explore a scene and build a 3D representation that is loaded into a simulator to finetune a policy of interest, e.g. a depth-only PointGoal agent.

| Policy | Success | SPL |
|---|---------|------|
| Finetuned on Gibson meshes (not comparable) | 99.7 | 97.9 |
| Pre-trained (no finetuning) | 90.2 | 82.9 |
| Finetuned on AutoNeRF meshes | 92.9 | 86.7 |
